

HVAC (Heating, Ventilation & Air Conditioning)

Central Climate Control and Chilled Water Distribution.

We design and install central HVAC systems incorporating centrifugal chillers, air handling units, cooling towers, and duct networks for large commercial and industrial developments. Our HVAC solutions integrate water conditioning and treatment to minimize scaling, improve system efficiency, and ensure reliable long-term operation.

Key Features & Applications

KEY HIGHLIGHTS: - Central chiller layouts optimized for commercial cooling loads - High-performance air handling and mechanical ventilation - Integrated water pre-treatment to protect condenser loops - Smart BMS integration for automation and energy tracking	COMMON APPLICATIONS: - Shopping malls and retail developments - Hospitality hotels and medical centers - Corporate offices and high-rise buildings - Industrial process cooling loops

System Process & Flow

Stage / Phase	Description
Thermal Exchange	Chillers produce chilled water that circulates supplying AHUs to provide conditioned air.
Air Distribution	AHUs regulate and distribute conditioned air through a network of ducts and diffusers.
Heat Rejection	Cooling towers reject heat from the chilled-water system to the atmosphere.
Water Conditioning	Integrated water treatment systems control scale, corrosion, and fouling within cooling loops.
