

Aqua Clean Lake/River Water Treatment System

High-Efficiency Surface Water Purification.

Aqua Clean surface water treatment systems are designed to treat highly turbid lake and river water with varying organic loads. By combining clarification, chemical coagulation, filtration, and disinfection, the systems produce safe, high-quality water for communities, estates, and other applications. Our systems are available in skid-mounted or containerized configurations and are designed for efficient installation, reliable operation, and deployment in remote and rural locations.

Key Features & Applications

KEY HIGHLIGHTS: - Engineered for high turbidity and variable organic content - Rapid coagulation-flocculation basins with lamella clarifiers - Integrated final UV and chlorine disinfection channels - Skid-mounted containerized designs for rapid deployment	COMMON APPLICATIONS: - Off-grid agricultural farms and irrigation - Remote resorts and community drinking systems - Municipal backup water supplies - Industrial process water extraction

System Process & Flow

Stage / Phase	Description
Clarification	Coagulant dosing promotes the removal of mud, silt, and algae in lamella settling units.
Polishing	Clarified water passes through sand and carbon filters to remove taste, odor, and organics.
Disinfection	The filtered water is disinfected using chlorination or UV for microbial control.
Treated Water	The final treated water is collected for potable supply in accordance with required standards.
